New Vacuum Lamp
Appearance

Frame Support and Other Components

– Supports the arc tube and provides electrical connections to components. Welds are susceptible to breakage due to excessive vibration or rough handling

Normal End of Life indication - Sodium Loss depicted by yellowing of lamp outer jacket

Newly Produced Arc Tube – Bright white appearance – Ends will appear ‘dark silver’ at installation due to 100% start up testing and chemicals depositing after the initial cool down. Ends will clear during initial operation, and then over life tungsten will deposit at ends gradually darkening them

Arc Discharge in Outer Jacket – Lamp experienced a seal leak that resulted in an arc discharge in the outer jacket during lamp operation

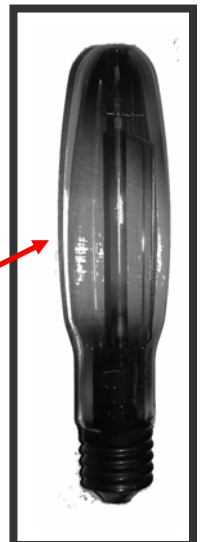

Getter Flash – Mirror-like Finish

Getter Flash absorbs oxygen, hydrogen and other impurities present within the lamp. These impurities can result in the rapid deterioration of the metal parts...resulting in lamp failure

Normal End of Life - Due to arc tube crack or seal failure

Arc Tube Crack/Leak - Mercury Sodium Amalgam coats the inside of the glass bulb
